FOREWORD

Providing and financing an adequate water supply is of continuing concern for municipal officials in Missouri. Since sources of supply, treatment and distribution systems, water use requirements and operational policies vary widely to meet local conditions, a survey of this type does not provide specific conclusion regarding necessary or desired policy or equitable rates. This study, however, makes available information on existing policies and rates and provides local information regarding source of supply and treatment that may be helpful in observing how other cities and villages have handled these matters.

This technical bulletin is a revision of the 2000 League study of water rates and policies in effect in Missouri municipalities. Information in this bulletin was obtained from a questionnaire sent by League staff to all member cities.

Our research staff has taken the liberty of interpreting some of the information submitted in or with the questionnaire. While the information is as accurate as possible, we admit to the possibility of inaccuracies within this publication. Also, because of the time period between collection, tabulation and distribution, some cities may have altered their water system policies.

We sincerely appreciate the cooperation of municipal officials in contributing information for this publication and welcome any suggestion or corrections.

MUNICIPAL WATER UTILITIES

WATER POLICY AND RATE SURVEY

General Information

The Missouri Municipal League published its first *Water Rates and Policies in Missouri Municipalities* technical bulletin in 1967. In order to reflect the continually changing policies in Missouri municipalities, we have periodically updated this report; this study represents the ninth revision.

This bulletin represents responses from 334 municipalities, of whom 104 reported that they do not own or operate a water utility, leaving 230 responses from municipalities that do operate their water company.

Not only must a municipality provide an adequate, potable water supply, it also must charge the customer in a manner that will pay the cost of water distribution. This charge is commonly referred to as the water rate or schedule of charges. Since each municipality develops a rate schedule tailored to its own needs and operating costs, rate schedules will vary from one municipality to another. Thus, this updated bulletin is intended to inform municipal officials of the current water rates and policies in effect in other municipalities and to permit meaningful comparisons. With this understanding, the present study focuses upon the following topics:

1. the sources and treatment of water supply;
2. who pays for the water main, service connections, and maintenance of facilities;
3. service connection charges and meter deposits;
4. water costs to residential customers inside and outside the city;
5. policies concerning penalties and reconnection fees after shut-off for nonpayment; and
6. the finances and operations of the water systems.

The policies carried out in each of these areas may affect some or all of the remainder. For example, if there is an abundance of subsurface water, the rates generally will be lower than in other areas. Similarly, if a municipality is required by local conditions to provide complete treatment and softening of its water, the cost of production generally will be higher and usually will be reflected by higher rates.

In order to facilitate comparisons, some tables and summaries have been grouped into three population categories: over 10,000, 2,500 to 10,000, and under 2,500.

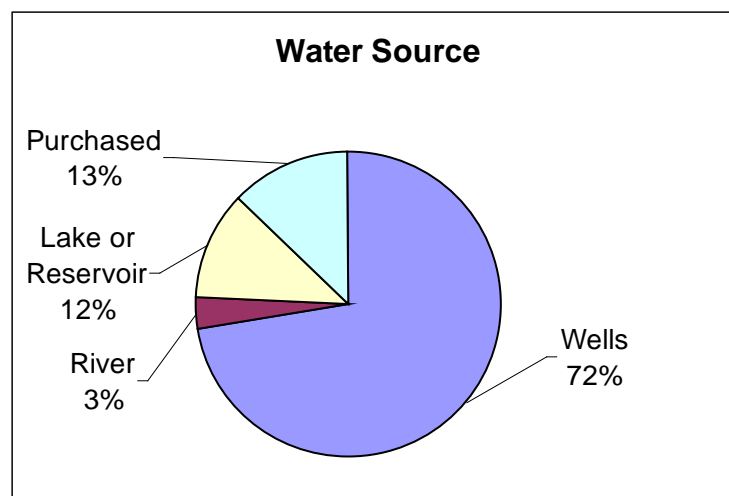

Own or Operate Water Utility

One hundred and four municipalities indicated that they do not operate their own water utility company. While 230 municipalities did indicate that they do operate their own water utility.

Source of Water Supply

The state of Missouri is quite fortunate in having an excellent water supply in much of the state. Principally this is caused by the enormous quantity of subsurface porous stone, (i.e limestone), which provides “aquifers” or “pipes” for underground water flow. Hence 72% of the municipal water supply comes from wells. Twelve percent of the total supply stems from lakes or reservoirs and 3% from rivers or streams. The remaining 13% is purchased from area water districts or neighboring cities. These findings are practically identical to the results of the 2000 survey.

Water Treatment

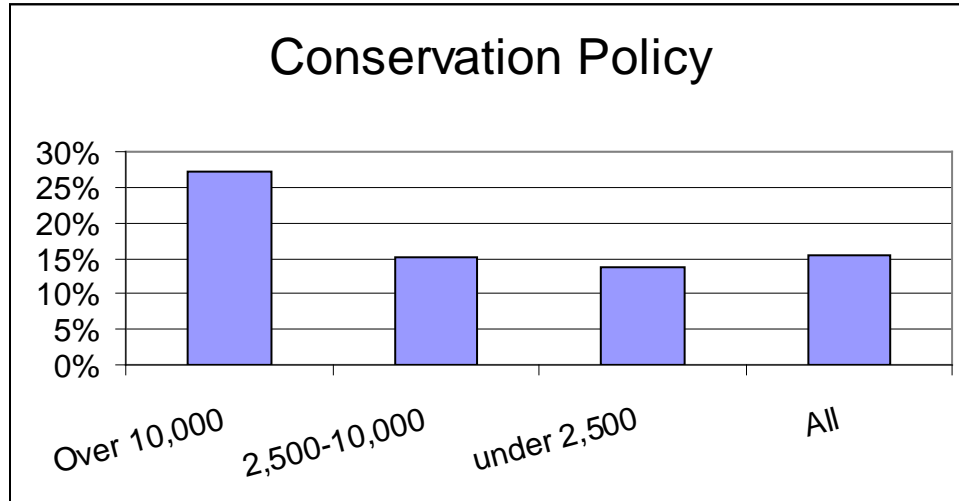

Results from this survey indicate that 18% of municipal water utilities do not perform any type of water treatment. These results show a slight increase in treatment from the 2000 survey findings of 22% performing no water treatment. This slight increase may be due to increased state and federal regulation. While 18 percent may seem like a large number of utilities not performing treatment, it should be kept in mind that ground water makes up the vast majority of the municipal water supply and it is not uncommon for wells to provide clean, uncontaminated water requiring no treatment.

Various types of water treatment are performed; the most common being chlorination and other types of disinfection. Fluoridation was also quite common with 37% of cities adding fluoride to the water. Sand filters were employed by about one-third of cities. Other treatment types were also utilized as illustrated below.

Water Conservation Policy

Sixteen percent of municipalities surveyed have a water conservation policy in place. Larger cities were more likely to have a conservation policy with 27% of cities over 10,000 having such a policy. In the 2,500 to 10,000 category the percentage fell to 15%, while in the under 2,500 group the percentage dropped to 14%. Many cities sent in their conservation policies along with the survey, copies of these policies may be requested by contacting League Headquarters.

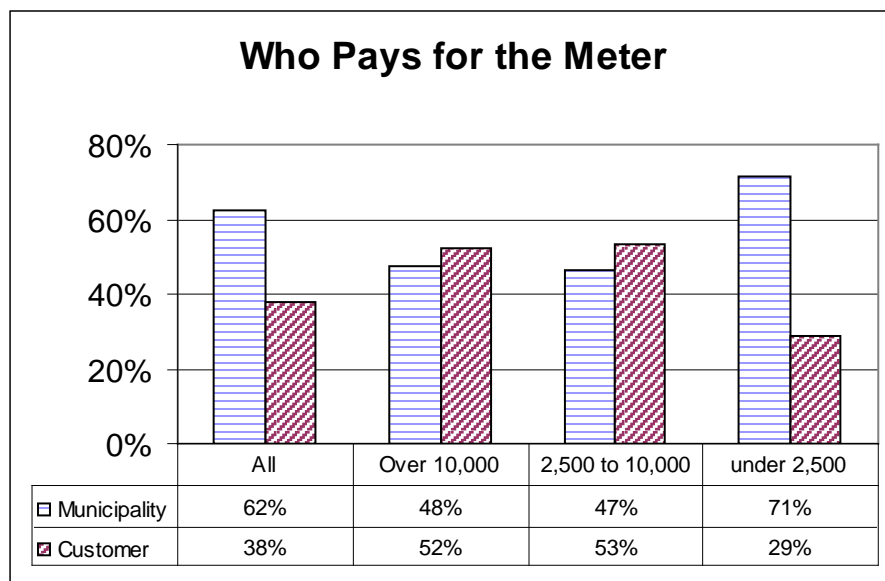

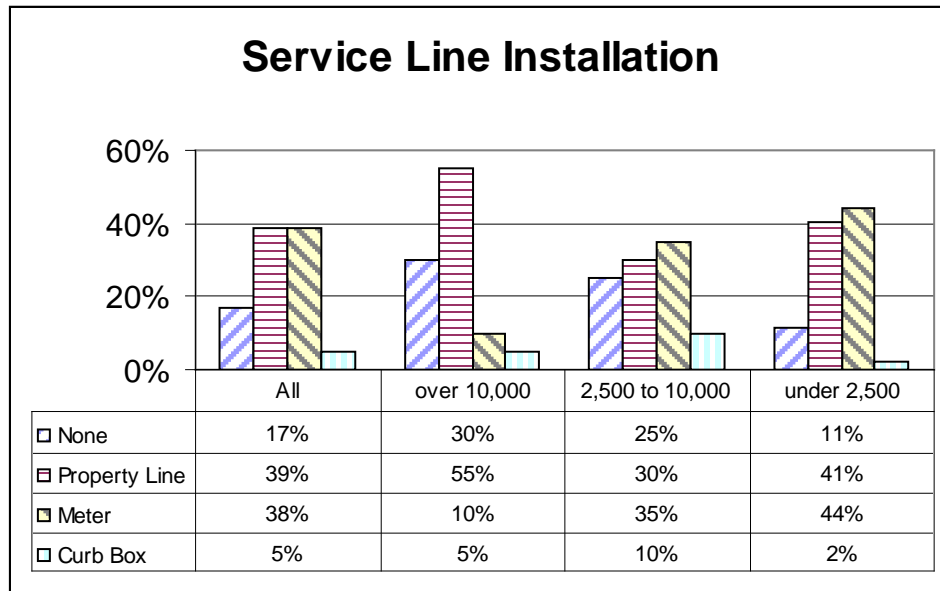

Financing of Distribution Mains

Fifteen percent of municipalities responding to this question pay for the cost of new distribution mains. This is down from the 23% calculated in the 2000 survey. The biggest drop occurred in the under 2,500 category, going from 45% of municipalities bearing the cost down to 17% in this survey. Tabulated below are the percentages of who bears the costs categorized by population.

Financing of Service Lines and Meters

Eighty-three percent of cities answering this question indicated the city built a portion of the service lines. Thirty-nine percent built out to the property line, while 44% built out either to the meter (38%), to curb box/stop box (5%), or to the street (1%). The graph below shows how the service line installations breakdown for the bigger and smaller cities. Generally, the larger the city, the less likely it is to extend the service lines out further. For instance, only 10% of the over 10,000 population cities build out to the meter, while 44% of the under 2,500 cities did. The same general trend appears when looking at who pays for the meter, with larger cities being more likely to require the customer to purchase the new meter.

Maintenance of Service Lines

Based on the survey results it appears that many Missouri municipalities provide maintenance further out on the service line than they build. For instance, 43% of all cities build out to the meter or curb box, while 76% of all cities provide maintenance that far. In addition, smaller cities tend to provide the maintenance further out than the larger cities. For example, 78% of smaller cities provide maintenance to the meter, while only 52% of the larger cities did.

Deposits

Most municipalities responding to this portion of the survey indicated that a meter deposit was required to insure payment of accounts. See Table V for a listing of the deposits charged by particular cities. Twenty-nine percent of cities reported charging renters a higher deposit than homeowners. Table V also lists the deposit amounts charged to renters. Additionally, 12% of respondents reported that homeowner's deposits were refunded after a set time period but not renters.

Landlord Accountability

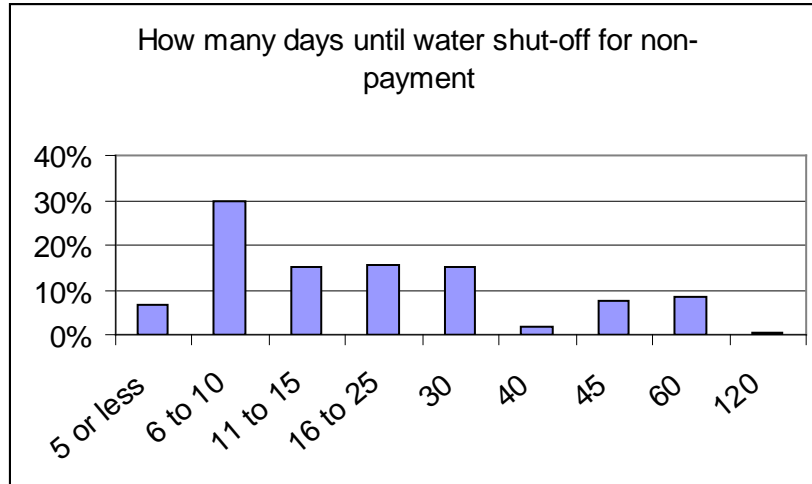

Section 250.140 Missouri Revised Statutes (RSMo) allows municipalities to hold landlords accountable for the delinquent utility accounts of their renters. Overall 42% of cities answering this question have enacted a policy exercising this power. Interestingly the breakdown for population groups showed mixed results. Large cities were much more likely to utilize 250.140 RSMo, medium cities were just the opposite, and the smaller cities were evenly split.

Late Fees and Penalties

Over 95% of the municipalities answering this section indicated they assessed some form of penalty for late payments. More than 80% indicated the penalty was based on a percentage of the delinquent bill while about 17% charged a flat fee. Forty-five percent of those assessing a flat fee charged \$10, while about 25% charged \$5. Various other amounts were charged in much lower percentages. Of the cities assessing a percentage fee, 10% was the most common, making up almost 75%. Five percent was the second most common amount, with 15%. Various other percentages made up the remainder.

Municipal policy varies greatly on the amount of time elapsed before shutting off water service following non payment of the water bill. As many as 7% shut the water off within 5 days for nonpayment, while over 15% waited 45 days or longer. The graph on the next page illustrates these results.

Following disconnection for nonpayment, almost all cities reported charging a reconnect fee to cover the labor costs of the action. Fees ranged from \$5 to \$100 with about 40% charging \$25, 13% charging \$50, 12% charging \$20 and a variety of other amounts making up the remainder. Approximately 7% of those surveyed indicated that the fee increases upon second and third disconnects. About 55% reported that reconnections were available during off hours. Of those cities, 60% reported charging an additional fee for the reconnect during off hours. Additional fees for reconnection during these non-business hours ranged from \$10 to \$100, with \$25 being the most common.

Rates

In order to fund the municipal water utility all municipalities charge some form of fee for the usage of the system. Ninety-four percent of those surveyed indicated their rate charges were based on gallons, while 6% use the cubic feet measure. Two cities reported not having any meters and just charging a flat rate (one charged \$15 per month for water service, the other \$110 per year). Almost all cities reported charging a minimum fee ranging from \$2 to \$35 per month. Of those, 80% reported providing at least some amount of water with that minimum fee. This amount ranged anywhere from 99 gallons to 10,000 gallons. One thousand gallons was the typical amount, making up about 60 percent. Approximately 25% of cities provided 2,000 gallons with the minimum charge, while about 5% provided 1,500 gallons, and another 5% provided up to 3,000 gallons. Various other amounts made up the remaining 5%.

Some cities also vary their minimum fee based upon the size of the meter installed. Others varied the minimum fee based on commercial vs. residential usage. Fees also varied for non-residents and this is discussed on page 13.

In addition to imposing the minimum charge, most cities impose an additional fee based on usage. For a few cities this additional fee is a set amount per quantity. For example, one city reported charging a minimum fee of \$8 and this includes the first 2,000 gallons, for water used in excess of 2,000 gallons \$3.25 per 1,000 gallons is added to the monthly bill. The majority of cities use a more complicated system known as a “block” or “bracket” system. Under this system, the rates charged for each quantity of water vary based upon which step in the block system the customer has reached. For example, another city reported charging \$5 for the first 1,500 gallons plus \$.18 per 100 gallons for the next 18,500 gallons, + \$.16 per 100 gallons for the next 18,500 gallons, + \$.16 per 100 on the next 30,000 gallons and \$.11 per 100 gallons thereafter. In the vast majority of municipalities the rate decreased with greater usage. This practice stems from the principle of economies of scale. Overhead, capital costs and operation costs normally decrease at greater volumes, and these savings can be passed on to the customer. However, the rates should not decrease to a point below the actual cost to the municipalities of producing, treating, and distributing the water.

No uniformity among municipalities as to either the number of brackets or the size of the brackets was found. Most often the charges were based on per 1,000 gallon usage, but some cities used 100 gallons and others per gallon. Additionally, six percent of those surveyed used the cubic foot measure instead of gallons. One city even has different rates for summer time usage.

Table VII provides a listing of the minimum charges, the amount of water provided with that fee and a complete listing of the fee schedule as reported.

Outstanding Bond Issues

Most municipalities finance water system projects through the passage of general obligation and revenue bonds. Fifty-seven percent of those municipalities responding to the survey reported having outstanding bonds: 61% using revenue bonds, 30% using general obligation, and 9% using a combination or some other type of bond mechanism. For a complete listing of survey data on bond issues, see Table VIII.

Rate Increases

Most municipalities have increased their water rates in recent years. Sixty-three percent indicated they had a water rate analysis done as part of the process. Eighty-five percent indicated they had increased the rates within the last 10 years. Seventy-five percent had done so within the last five years and 60% had increased the rates within the last three years. Additionally 47% contemplated a rate increase this next year. Of those contemplating a rate increase next year, the percentage of the increase ranged from 1% to 50% with 10% being the most common increase amount. See Table VIII for a complete listing of the survey results on this issue.

Finances and Operations

Eighty-seven percent of municipal water utilities indicated that the utility's finances were self sufficient. It is not uncommon for municipal utilities to share in supporting the costs of the municipal operations. Thirty percent of those answering this question indicated that they transferred funds to the city's general revenue. The basis for these transfers was usually to help offset the administrative costs of the utility (i.e. space at city hall and personnel time). Some municipalities also made PILOT (payments in lieu of taxes) transfers, usually based on a set percentage such as 5% of gross revenue.

Water Service Outside City Limits

Seventy-four percent of those answering this portion indicated that the municipality provided water service outside of the city limits. Only 15% of municipalities indicated that the city paid any portion of the costs for the extensions of the water mains outside of the corporate limits. Even though few cities paid for the costs of the extensions, 85% of municipalities maintained control over the water system outside of the city. Approximately one-third of the cities indicated that the rates charged for water usage outside of the city was the same as that charged to residents. Eighty-seven percent indicated that the rates charged were enough to cover the costs of the service outside the city limits. And about one-third of municipalities with water utilities indicated they sold water to other water utilities.

Table I. Municipalities That Do Not Operate Water Utility

The following municipalities indicated that they do not own or operate a water utility.

Agency	Flint Hill	Noel
Airport Drive	Florissant	Norwood Court
